Next DLP

Next DLP protects your data and devices through the Reveal Platform. Data loss and malicious insiders can be catastrophic for business, whether it's a leak of confidential information, intellectual property or a breach of a compliancy regulation. The most likely cause is human error, and it can happen any time. The Reveal Platform from Next DLP uncovers risk, educates employees and secures your organisation's data.

Why we partner with Next DLP

Next DLP is a leading provider of insider risk and data protection solutions. Reveal, their flagship software, is a flexible, cloud-based, machine-learning solution built for the modern threat landscape, and is trusted by organisations of all sizes.

The challenges Next DLP solves

Next uses AI technology to identify unusual activities on your device. It analyses behaviours, compares patterns, and learns from your data. This helps keep your information safe without bothering you with complicated settings. Not only does it keep you secure, but it keeps you efficient.

Next records, alerts, blocks actions, isolates machines and can even take steps to keep your data safe, like isolating your device from the network if needed. Instead of watching long training videos, Next teaches you when it matters. If there's a potential risk to your data, you'll get a notification. Next guides you to the right way to get your work done safely.

How Next DLP benefits your business

Real-time continuous monitoring captures and records events in real time, protecting your data from threat and reducing breaches.

User training provided at the point of risk to educate you immediately when your data is most vulnerable.

Machine learning on the end point identifies typical vs. unusual behaviour to understand where there's risk.

Adaptive controls allow you to decide what actions to take when a user breaches a policy.
